

Compute Resources

A **compute target** is a designated compute resource or environment where you run training scripts or host your service deployment. There are two different variations on compute targets that we will discuss below: **training compute targets** and **inferencing compute targets**.

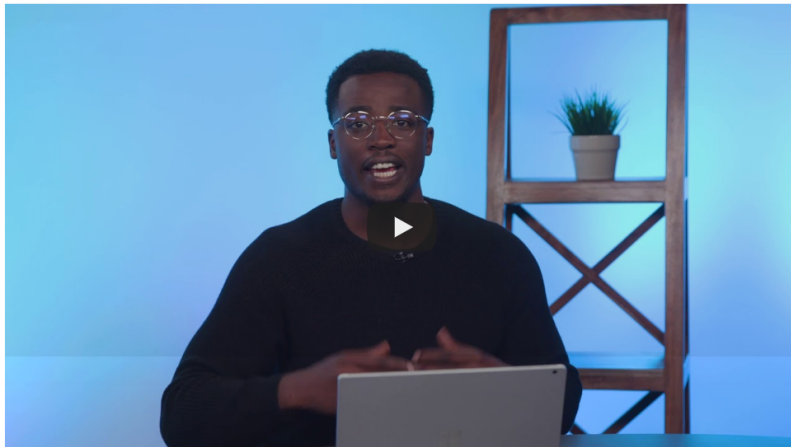

Training Compute

First, let's talk about compute resources that can be used for model training.

Inferencing Compute

Once you have a trained model, you'll want to be able to deploy it for inferencing. Let's take a look at the compute resources you can use for different types of inferencing.

QUIZ QUESTION

Which of the following compute targets are *not* managed by Azure Machine Learning?

- ☐ Compute instance
- ☒ Azure Container Instances
- ☐ Compute clusters
