

Managed Notebook Environments

Notebooks are made up of one or more cells that allow for the execution of the code snippets or commands within those cells. They store commands and the results of running those commands. In this diagram, you can see that we can use a notebook environment to perform the five primary stages of model development:

The best way to understand how managed notebook environments work is to jump in and work with one—so that's what we'll do in the next lab, by training a simple SciKit learn model on a medical dataset.
